

Quizzing Application Suite 2.x

Administrator Tools - Question Editing Instructions

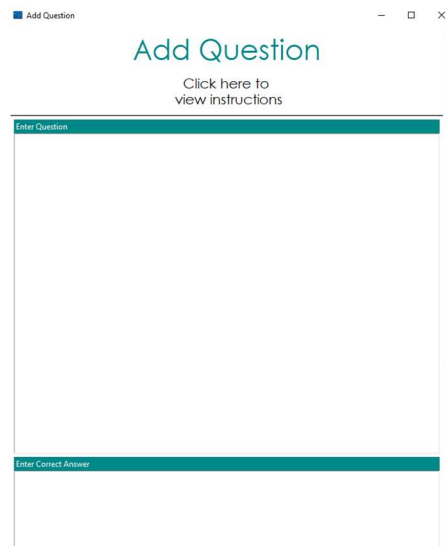

By **Geetansh Gautam**, Developer of Coding Made Fun
Applicable to QAS Versions **2.00.00 → 2.99.99**

1: Adding Questions

In order to add a question, open the **Quizzing Application Admin Tools** program and navigate to the “Questions” tab:

Next, click on “Add a Question;” a prompt like the following should show up:

1.1: Adding a normal question

In order to add a normal question, simply add your question to the “Enter Question” box and add the answer to the “Enter Correct Answer” box. Ignore the “Multiple Choice” and “True/False” options; instead, click on the “Add Question” button.

1.2: Adding a True/False question

In order to add a True/False question, simply add the question to the “Enter Question” box, and add one of the accepted values into the “Enter Correct Answer” box; then, click the “True/False” button, making sure it is selected, and finally click the “Add Question” button (see 1.2.2 – Accepted Answers)

1.2.2: Accepted Answers (Admin-Input)

The answer detection algorithm is very lenient; it considers any word to have the character “t” or “T” in it as “True” and any word with the letter “f” or “F” in as “False”

Tolerance: “T1234” will be seen as “True,” whereas “f12323” will be seen as “False.”

Additional Notes:

- i. The answer field is **not case sensitive**; “t” is the same as “T,” whereas “f” is the same as “F”
- ii. If neither “T” (or “t”) nor “F” (or “f”) is in the answer box, the application will see the question as an error
- iii. If both “T” (or “t”) and “F” (or “f”) are in the answer box, the application will see the question as an error
- iv. Because the question is marked as a “True/False” question, the user will not have to type a response, instead two buttons (one saying “True” and one saying “False”) will be displayed.

Valid Syntax:

T < or t>
F <or f>

Or

Tt <or any other variant>
Ff <or any other variant>
Or
True <or TRUE, or true, or tTRUE, etc.>
False <or FALSE, or false, or fALSE, etc.>
Or
<anything> t <anything>
<anything> f <anything>

1.3: Adding a Multiple-Choice question

Adding a multiple-choice question is relatively straight forward, where you must first add your question to the “Enter Question” box (see 1.3.2 – Adding Options) and add the correct “*handle* (see 1.3.2 – Adding Options)” to the “Enter Correct Answer” box (see 1.3.3 – Accepted Answers). Following, click the “Multiple Choice” selector button, making sure it is selected, and finally click the “Add Question” button.

1.3.2 – Adding Options

Definitions

- “handle” : “the option name i.e., ‘a,’ ‘b,’ ‘1,’ etc.”

In order to add options, you must add **[QAS :: Option]** immediately before the option, followed by a space and then an opening SQUARE bracket; add the “handle,” which is the option name, followed by a closing square bracket, then write out the text of your option.

Note that the “[QAS :: Option] [“ and the closing square bracket will not be shown to the quiz taker, but will be visible to the admin.

Valid Syntax

QUESTION: <question> [QAS :: Option] [<handle>] Option
ANSWER: <handle>

Example

What is the URL to the source code of this project?
[QAS :: Option] [Coding Made Fun] https://codingmadefun.wixsite.com/home/qas
[QAS :: Option] [GitHub] https://bit.ly/cm-f-qas
github

1.3.3 – Accepted Answers

A valid answer is one of the “handles” provided in the question.

Notes

- You can have as many options as you like!
- The options are not case-sensitive
- The handles will be displayed, regardless of the formatting of the answer.

1.4: Evaluation algorithm tolerance

The evaluation algorithm used is fairly lenient; it removes all spaces and ignores the letter-case of the answer; as such, “**SAMPLE ANSWER**” and “**s a m p l E a n s w e R**” are seen as the same answer. (for all question types)

Important: If there was an error in one of the questions, the Quizzing Form will disregard said question.

2: Deleting Questions

To delete a specific question, browse to the “[View Questions](#)” form, find the question you want to remove and click “[Remove Question](#)” button. To remove all questions, click “**Delete All Questions**” button in the question entry form.

Warning: Deleting questions, unlike previous versions, no longer logs the change due to privacy concerns; as such, this process is irreversible.
